                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Homo
```

```
The present sequence is the fusion protein construct, pIL2LTrim3. This construct comprises of the leader peptide from human interleukin 2 (hIL2) and soluble CD39 (solD39) protein region, having apyrase activity.

CC soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP transmembrane concentrations and the ability to block and reverse ADP- contraction and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting aggregation. Soluble CD39 polypeptides are useful for inhibiting approaches in its useful for the treatment of unstable anglia, stroke, myocardial infarction, coronary artery disease or injury, embolism, camporaled ischaemic disorders including lung, coronary and cerebral aspeciated ischaemic disorders including coronary, peripheral and cerebral artery thrombosis, intracardiac and venous thrombosis, cogulopathy, deep venous thrombosis, intracardiac and venous thrombosis, cransient ischaemic attack. Soluble CD39 is also useful for preventing transient ischaemic attack. Soluble CD39 is also useful for preventing crestenosis of blood vessels or stroke
inhibiting angiogenesis and treating unstable angina, myocardial infarction, stroke, coronary artery disease or injury.
                                                                                           Claim 6; Page 113-114; 122pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 474 AA;

Marcus AJ; Gayle RB, Maliszewski CR,

WPI; 2000-339518/29.

Inhibiting platelet activation and recruitment, useful for treating a mammal suffering from unstable angina, myocardial infarction, stroke, coronary artery disease or injury, comprises administering soluble CD39 polypeptides

Example 11; Page 113-114; 118pp; English.

The present sequence is the protein encoded by Trim3 construct. pIL2Trim3 constructed by removing the human IL2 residues from solCD39 (variant was constructed by removing the human IL2 residues from solCD39 fusion construct. Fusion of I2 amino acids from the N-terminus of mature human IL2 to the solCD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. SolCD39 is used in the treatment of unstable angina, myocardial infarction.

CC stroke, coronary artery disease or injury, atherosolerosis, peripheral vascular occlusion, precelampsia, enbolism, platelet-associated ischaemic disorder including lung ischaemia, coronary lactbeamia and cerebral cebral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, thrombosis, thrombosis, cerebral artery thrombosis, thrombosis, thrombosis, cerebral artery sembolism (PB), transient ischaemic attack.

CC soluble CD39 is also useful for preventing thrombus formation or reformation, reocclusion, stenosis or restenosis of blood

The present sequence is a fusion construct, comprising the N-terminal amino acids of mature human interleukin2 (IL2) and soluble CD39 (solCD39) cregion, that has apyrase activity. This results in high levels of solCD39 cregion, that has apyrase activity. This results in high levels of solCD39 creating the capacity to metabolise ATP and ADP at relavant concentrations and the ability to metabolise ATP and ADP at relavant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides crecruitment, including platelet aggregation is useful for inhibiting analysements. It is useful for the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, precelampsia, connary and cerebral ischaemic dischaemic disorders including coronary, peripheral and cerebral actery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PE) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        360

The present sequence is the protein enocoded by a fusion construct of sol(soluble)CD39 having apyrase activity. Fusion of 12 amino acids from the N-terminus of mature human II2 to the solCD39 coding region results in high levels of mature human II2 to the solCD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. This is used in the treatment of unstable angina, atherosclerosis, peripheral vaccionary artery disease or injury, atherosclerosis, peripheral accolnary occlusion, precelampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, coronary ischaemia and cerebral ischaemia, thrombosis, intracardiac thrombosis, peripheral artery thrombosis, varous thrombosis, intracardiac thrombosis, pripheral artery thrombosis (varous thrombosis, thrombosis, thrombosis, transient ischaemic attack. Solubie CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or
        Soluble CD39; ADP-induced platelet activation; platelet aggregation; unstable angina; myocardial infarction; stroke; oconary artery disease; atheroselerosis; peripheral vascular occlusion; preeclampsia; embolism; platelet-associated ischaemic disorder; lung ischaemia; thrombolytic; cerebral ischaemia; thrombotic disorder; coronary artery thrombolytic; perebral artery thrombosis; intracardiac thrombosis; venous thrombosis; peripheral artery thrombosis; coagulopathy; deep vanous thrombosis; peripheral artery thrombosis; coagulopathy; deep vanous thrombosis; py; pulmonary embolism; transient ischaemic attack; thrombos formation; ceclusion; recoclusion; etenosis; restenosis; antianginal; cardiant; cerebroprotective; antiarteriosclerotic; vasotropic; anticoagulant; coronary ischaemia; vascular occlusion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inhibiting platelet activation and recruitment, useful for treating a mammal suffering from unstable angina, myocardial infarction, stroke, coronary artery disease or injury, comprises administering soluble CD39 polypeptides:

 The present sequence is the fusion protein construct, pIL2LTrim4. This construct comprises of the leader peptide from human interleukin 2 (hIL2) and soluble CD39 (solCD39) protein region, having apprase activity.

Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP- induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angingenesis. It is useful for the treatment of unstable angina, stroke, myocardial infarction, coronary artery disease or injury, embolism, atherosclared is peripheral vascular occlusion, precelampsia, platelet associated ischaemic disorders including lung, coronary and cerebral actery thrombotic disorders including coronary, peripheral and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PB) and translent ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, ceclusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The present sequence is the protein encoded by Trim4 construct. pIL2Trim4 variant was constructed by removing the human IL2 residues from solCD39 fusion construct. Fusion of 12 amino acids from the N-terminus of mature human IL2 to the solCD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. SolCD39 is used in the treatment of unstable angian, myocardial infarction, stroke, coronary artery disease or injury, atherosolerosis, peripheral disorder including lung isohaemia, coronary ischaemia and cerebral ischaemia, a thrombosic disorder including coronary artery thrombosis, cerebral artery thrombosis, intracardiac thrombosis, peripheral artery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inhibiting platelet activation and recruitment, useful for treating a mammal suffering from unstable angina, myocardial infarction, stroke, coronary artery disease or injury, comprises administering soluble CD39
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     thrombosis, venous thrombosis, thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PR), transient ischaemic attack. Soluble (D39) is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 473;

The present sequence is a fusion construct pIL2LsolCD39, comprising the leader peptide of human interleukin 2 (hIL2), 12 amino acids from the mature N-terminus of hIL2 and soluble CD39 (solCD39) coding region, having apyrase activity. This produces high levels of solCD39 expression and activity in the transfected cells. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and crecruitment, including platelet aggregation. Soluble CD39 polypeptides recruitment, including platelet aggregation. Soluble CD39 polypeptides constable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, coronary and cerebral ischaemia, thrombotic disorders including lung, peripheral and cerebral artery thrombosis, intracardiac and venous thrombosis, copying thrombosis, copying thrombosis (but preventing thrombus formation or reformation, occlusion, reocclusion, for preventing thrombus formation or reformation, etroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the fusion protein construct piliziFlagSolCD39, comprising the leader peptide of human interleukin 2 (hIL2), 12 amino acids from the mature N-terminus of hIL2, a linker, FLAG tag sequence and soluble CD39; [SolCD39] protein region, that has apyrase activity This produces high levels of solCD39 expression and activity in the transfected tells. Soluble CD39 is constructed by removing the N- and C- terminal transmembrana domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting anginesis: It is useful for the treatment of unstable angina, mycardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism, corerbral ischaemia, thrombotic disorders including lung, coronary and cerebral artery thrombosis, intracardiac and venous thrombosis, and cerebral artery thrombosis, intracardiac and venous thrombosis of transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  111

plasmid. This was used for the transient expression of solCD39 protein in mammalian expression systems. SolCD39 is used in the treatment of mammalian expression systems. SolCD39 is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, dtherosclerois, peripheral vascular occlusion, preeclampsia, schaemia, coronary ischaemia and cerebral ischaemia, thrombotic disorder including coronary artery thrombosis, cerebral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, thrombosis, carebral artery thrombosis, thrombosis, cambolism (PR), transiant ischaemia ettack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion,

The present sequence is a fusion protein construct CD39-L4-1, comprising the human CD39-L4 N-terminal region and soluble CD39 protein. CD39-L4 is a seretted apyrase, belonging to the CD39 family. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preclampsia, coronary and cerebral ischaemic thrombotic disorders including loronary, peripheral and cerebral artery thrombotis, intracardiac and venous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PE) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LSNYPFDFQGARIITGQEEGAYGWITINYLLGKFSQKTRWFSIVPYETNNQETFGALDLG 189

The present sequence is a fusion construct of human soluble CD39 encoded by CD39-L4-1 construct. CD39-L4 is a secreted apyrase belonging to the by CD39-L4-1 construct. CD39-L4 is a secreted apyrase belonging to the cycle family. The fusion construct is used for the expression and activity of soluble CD39 in CHO (chinese hamster ovary) cells. Soluble CD39 cetains the capacity of wildtype CD39 to metabolise ATP and ADP at retains the capacity of wildtype CD39 to metabolise ATP and ADP at physiologically relevant concentrations as well as the ability to block and reverse ADP-induced platelet activation and recruitment including platelet aggregation. This is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemia disorder including lung ischaemia, coronary strery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, capalopathy, deep venous thrombosis, intracardiac thrombosis, capulopathy, deep venous thrombosis, pulmonary embolism (PB), trombus formation or reformation, reocclusion, stenosis or transient ischaemic attack. Soluble CD39 is useful for preventing thrombus formation or reformation, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                275

```
The present sequence is the fusion protein construct, IgkappalsolCD39.

This construct comprises of the leader peptide from human immunoglobulin is gkappa, limited to the soluble CD39 (solCD39) protein region by few residues derived from human interleukin 2 (hIL2). SolCD39 has apyrase activity and is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting aggregation. Soluble CD39 polypeptides are useful for inhibiting anyocardial infarction, coronary artery disease or injury, embolism, atherosclerosis, peripheral vascular occlusion, preeclampsia, platelet-ischaemic disorders including lung, coronary and cerebral aschaemic disorders including coronary, peripheral and cerebral artery thrombotic disorders including coronary, peripheral and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PE) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis or blood vessels or stroke
unstable angina; myocardial infarction; stroke; coronary artery disease; atherosclerosis; peripheral vascular occlusion; preeclampsia; embolism; platelet-associated ischaemic disorder; thrombotic disorder; reocclusion; coagulopathy; deep venous thrombosis; pry; pulmonary embolism; PE; thrombus formation; occlusion; stenosis; restenosis; angiogenesis; antianginal; cerebroprotective; antiarteriosclerotic; anticoagulant; cardiant; vasotropic; thrombolytic; inhibitor; interleukin 2; IL2; Ig;

                                                                                                                                                                                                                                                             The present bequence is the protein encoded by IgkappalsolCD39 construct. This is used for transient expression of soluble (sol)CD39 in recombinant colls for determining enzymatic activity and platelet inhibitory activity for each protein product. SolCD39 is used in the treatment of unstable angina, myockrdial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemia, thrombotic disorder including coronary artery thrombosis, cerebral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis (brit, pulmonary embolism (PB), transient ischaemia attack. Soluble CD39 is also useful for preventing thrombos formation or reformation, occlusion, reocclusion, stenosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            365
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         378

The present sequence is the fusion protein construct, pILZITriml. This construct comprises of the leader peptide from human interleukin 2 (hILZ) and soluble CD39 (solCD39) protein region, having apprase activity. The two regions are joined by an intervening Ala residue. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It can the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of unstable angiam, attherosclerosis, peripheral vascular occlusion, preclampsia, platelet-associated ischaemic disorders including lung, coronary and cerebral ischaemia, thrombotic disorders including lung, coronary and cerebral ischaemia, thrombotic disorders including coronary, embolism (PB) and transient ischaemic attack. Soluble CD39 is also useful CD for preventing thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary coronary and cransient ischaemic attack. Soluble CD39 is also useful coronary and cransient ischaemic attack. Soluble CD39 is also useful
                                                                      Soluble CD39; solCD39; human; apyrase activity; platelet activation; unstable angina; myocardial infarction; stroke; ocronary artery disease; atherosclerosis; peripheral vascular occlusion; precelampsia; embolism; platelet-associated ischaemic disorder; thrombotic disorder; reocclusion;
                                                                                                                                                                                                                   coagulopathy; deep venous thrombosis; DVT; pulmonary embolism; PE; thrombus formation; occlusion; stenosis; restenosis; angiogenesis; antianginal; cerebroprotective; antiarteriosclerotic; anticoagulant; cardiant; vasotropic; thrombolytic; inhibitor; interleukin 2; IL2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1. .24

Sequence 1, Application US/09374586
Patent No. US20020138858A1
Patent No. US20020138858A1
SERENAL INFORMATION:
APPLICANT: Pinsky, David J.
TITLE OF INVENTION: CD39/ECTC-ADPASE AS A TREATMENT FOR THROMBOTIC AND TITLE OF INVENTION: ISCHEMIC DISORDERS
FILE REFERENCE: 0575/59167
CURRENT APPLICATION NUMBER: US/09/374,586
CURRENT FILING DATE: 1999-08-13
NUMBER OF SEQ ID NOS: 2
SOFTWARE: Patentin Ver. 2.1

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              14,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
